

4. Source Code Management (GitHub, Azure Repo, BitBucket, GitLab)
The technology to store the code with branching strategy is Git.
1. Protection policy enable hota hai (Direct koi main branch me push nahi kr skta hai)
2. Hmesha push krne ke lie branching strategy hota hai
3. Infra ke code ki branching Strategy ko bolenge trunk based branching strategy.
4. jaise hi koi requirement aaya ek naya rg banana, we will clone main branch and will create feature branch from main branch
5. We will push changes to feature branch
6. Push krne ke lie git add ., git commit and git push krte hai..
7. Jaise hi changes feature branch me push hota hai remote repo p, automatic yamll pipeline based multistage pipeline chline lgta hai
8. Pehle stage me sara scanning hota hai (Trufflehog, Tflint, Tfsec, gitleaks, Terratest opencost, chef inspect etc..)
9. Second stage me plan hota hai jaha pr sb init, validate, fmt, connectivity to azure using azure connection and terraform plan
10. If both stages are good, We will raise Pull Request.
11. PR will be reviewed by GitHub Copilot AI and Team members (Lead/Architect)
12. As soon as its merged in the main branch, again a pipeline will run and that will run all the scan, plan stage and it will run apply also..
