

Ek Bala Resume kaise banana hai
Maximum 2 pages
Format ek number hona chahiye
Clear Points hona chahiye
Copy Paste resume nahi hona chahiye. Sabka apni algo dharna chahiye...
Din me 2-3 baar naukri.com pr resume ka pdf upload karna hai... same hi pdf ka krdo mast phone se

Tell me about Yourself

I am xyz working in Axion Systems - I have total 10 years of experience from that from last 5 years I am working as a DevSecOps Consultant.

Currently, I am working in a very interesting project where I am working as a devsecops consultant for a big petroleum company where we are working on a monitoring and alerting dashboard app for petroleum refineries.

The Applications business use case is this customer have a lot of refineries across the globe and there are multiple motors/pumps in each of the refinery so there is a Industrial IOT device already created by the electrical Engineering team which is connected to the motor and it send RPM, temperature and other metrics to the Azure Event hub.

Using the data that we receive in event hub, Our Team is creating a Monitoring and Alerting Dashboard Application which is a 3 tier application. For that we have a frontend backend and database... Our frontend is written in React, backend in Python and Database is PostgreSQL.

For frontend, there are around 7-8 developers. For backend there are around 10-12 developers and database is also managed by the backend team.

My Responsibility in the Project is to Design the Landing zone, Automating Infra Deployment using Terraform and Creating and Maintaining CI/CD Pipelines in azure devops.

If you allow, I can explain the Landing Zone, terraform code and the ci/cd pipelines that we have designed in the project?

Landing Zone Explanation

So since our application is a monolithic 3 tier application, We are deploying frontend and backend on vms and for database we are using paaS services...

We have designed the landing zone in such a way that the endpoint of our application is application gateway where we have enabled WAF and SSL certs for security, behind this app gw, we have 2 vms on which frontend app is running. Behind that we have a internal loadbalancer that is loadbalancing between the 2 backend vms...

For Database we are using a SQL Server that is a PaaS service so we do not need to manage the high availability of the database as its managed by azure.

To securely ssh to the vms, we are using azure bastion and for storing secret we have a azure key vault.

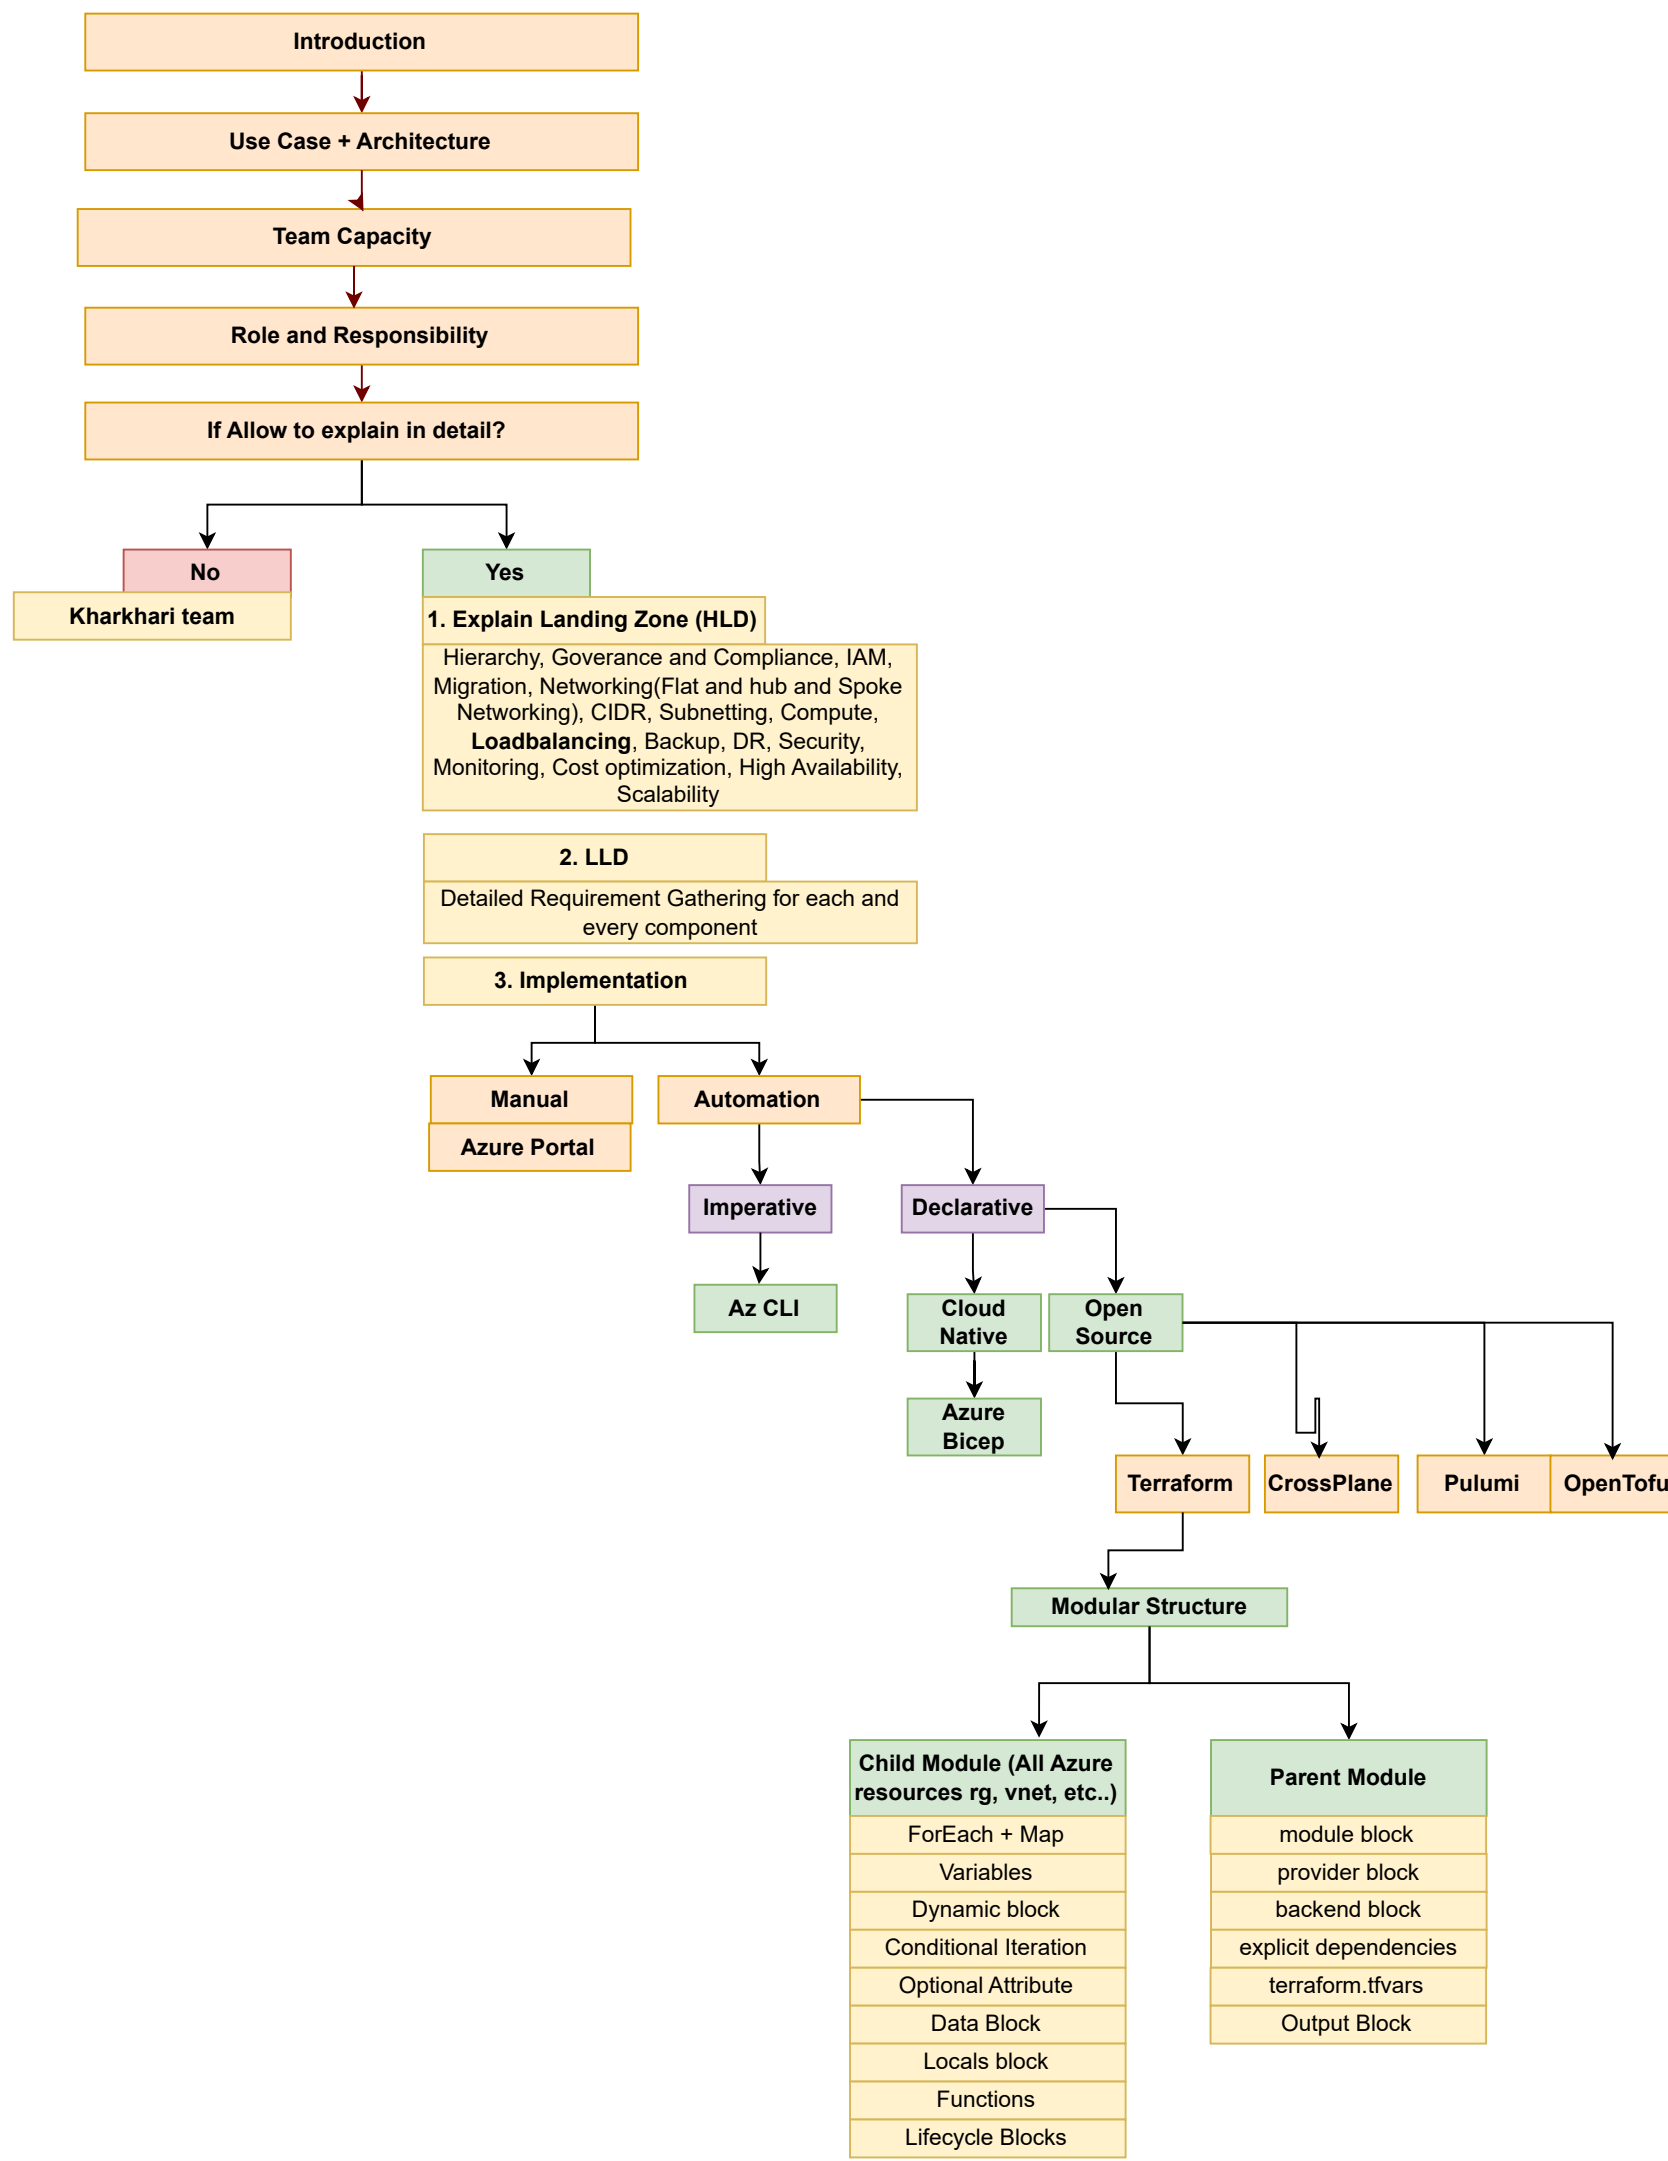

Terraform Setup

For all the azure resources that we have in our landing zone, we have created child modules for each like we have a child module for vm, app gw, key vault etc... in the child modules we use for each, map, dynamic blocks etc.

Since we have 3 environments of this application, Dev, QA and Prod

We have created a environments folder and inside that we have dev, qa and prod folders and inside dev folder we are calling the required modules for dev, and similarly for qa and prod folder we are calling the required modules for qa and prod environments.

In each environment folder we have set the backend block and we are storing our statefiles in azure storage accounts.

- 4. Source Code Management (GitHub, Azure Repo, BitBucket, GitLab)**
- The technology to store the code with branching strategy is Git.
1. Protection policy enable hota hai (Direct koi main branch me push nahi kr skta hai)
 2. Himesha push krme ke lie branching strategy hota hai
 3. Infra ke code ki branching Strategy ko bolenge trunk based branching strategy.
 4. jaise hi koi requirement aaya ek naya rg banana, we will clone main branch and will create feature branch from main branch
 5. We will push changes to feature branch
 6. Push krme ke lie git add, git commit and git push krte hai.
 7. Jaise hi changes feature branch me push hota hai remote repo p, automatic yam pipeline based multistage pipeline chlne lgta hai
 8. Penie stage me sara scanning hota hai (Trufflehog, Tfint, Ttsec, gitleaks, Terratest, openncol, chef-inspect etc.)
 9. Second stage me plan hota hai jaha pr sb int, validate, fmt, connectivity to azure using azure connection and terraform plan
 10. If both stages are good. We will raise Pull Request.
 11. PR will be reviewed by GitHub Copilot AI and Team members (Lead/Architect)
 12. As soon as its merged in the main branch, again a pipeline will run and that will run all the scan, plan stage and it will run apply also.
