

Plan

Mehnat ke bina nahi jee paenge...

Paise ke bina koi nahi puchega...

Jaldi kuch nahi hota...

Terraform is an IAC tool using which we can provision resources on multiple clouds.

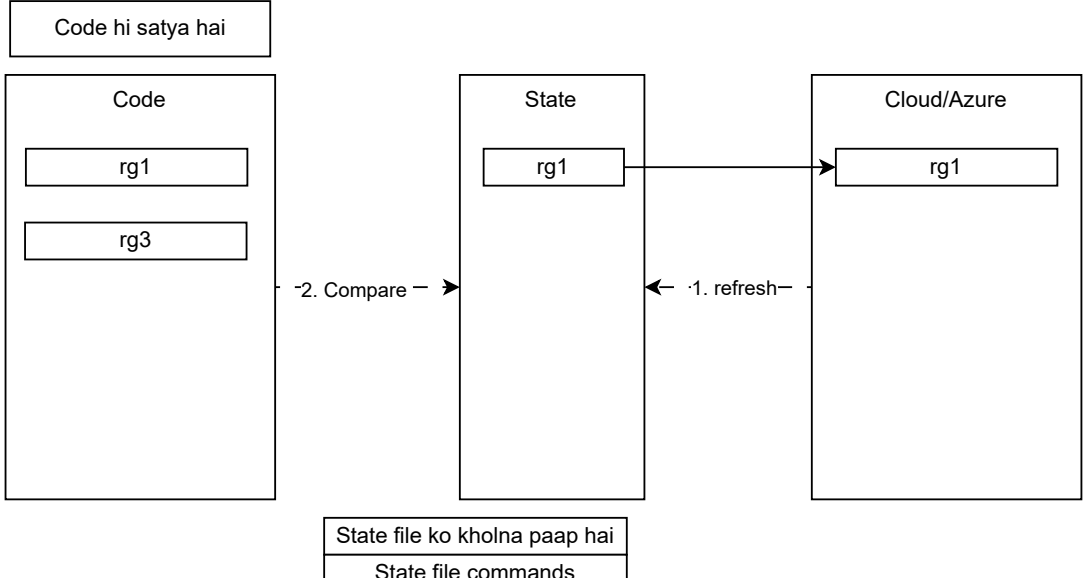

resource block

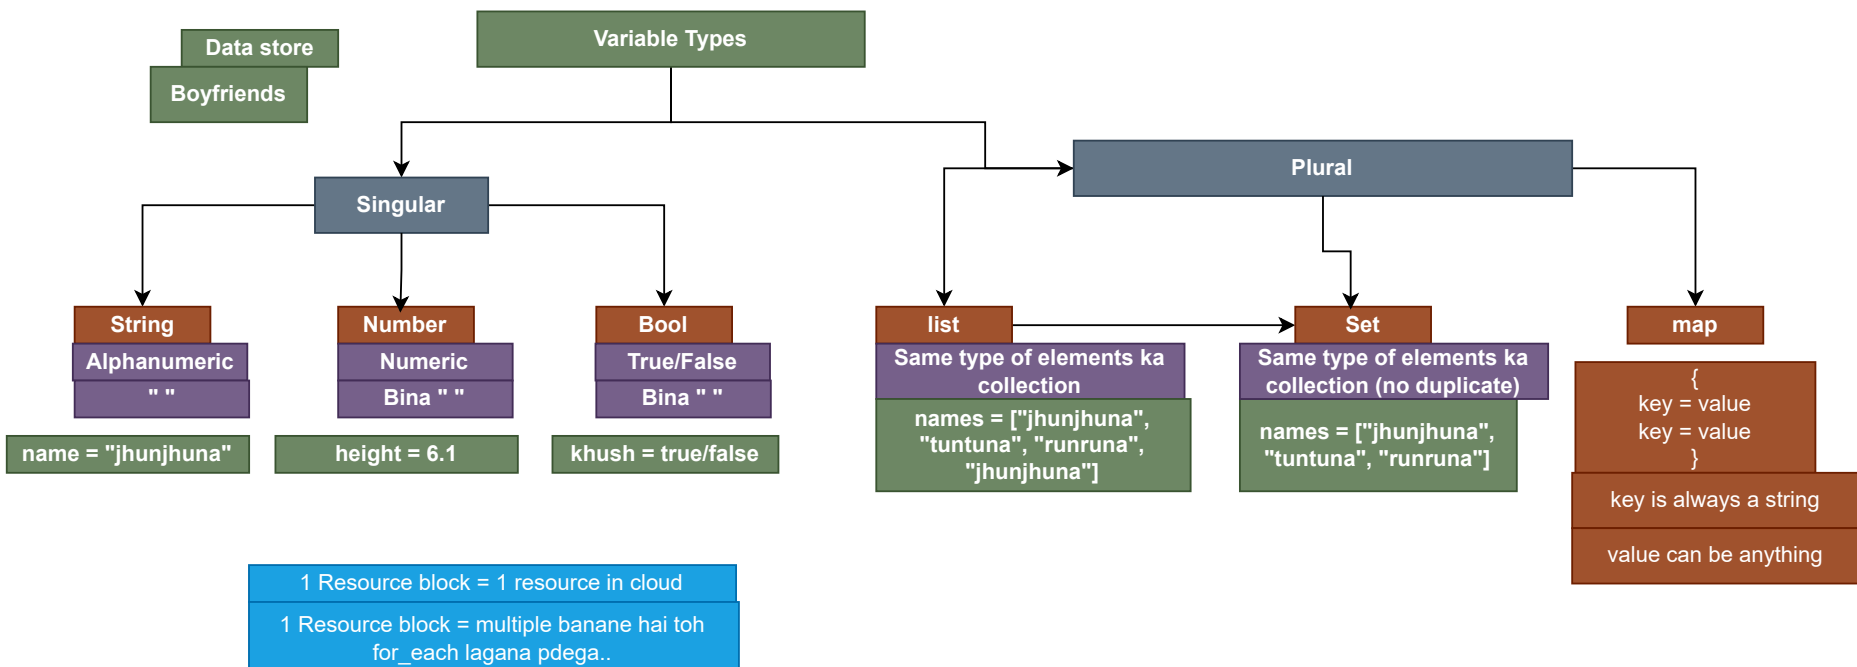

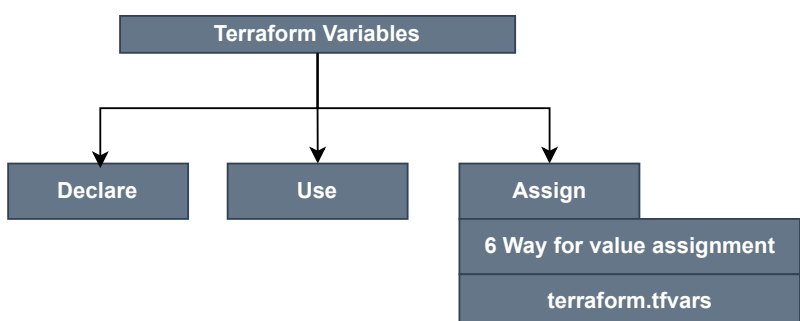

1 Resource block = 1 resource in cloud

1 rg = 1 rg block

1 sa = 1 sa block

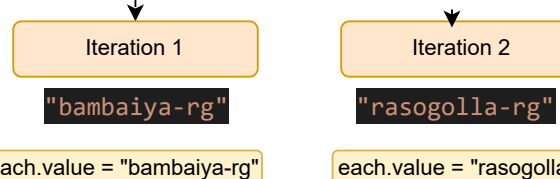

Scenario 1	Scenario 2	Scenario 3
Agar code me naya block add hua toh?	Agar code me naya block remove hua toh?	portal se agar kisi ne kuch delete kar dia toh?
1 to add	1 to delete	1 to add

```
bfs = {  
  "bf1" -> key1 = {  
    "name" = "jhunjhun"  
    "height" = 5.2  
    "colour" = "brown"  
  } -> value1  
  "bf2" -> key2 = {  
    "name" = "runjun"  
    "height" = 4.4  
    "colour" = "white"  
  } -> value2  
  "bf3" -> key3 = {  
    "name" = "runmun"  
    "height" = 8.5  
    "colour" = "wheatish"  
  } -> value3  
  "bf4" -> key4 = {  
    "name" = "tinku"  
    "height" = 2.6  
    "colour" = "oliveskin"  
  } -> value4  
}
```

ForEach + Set

```
resource "azurerm_resource_group" "rg1" {  
  for_each = toset(["bambaiya-rg", "rasogolla-rg"])  
  name     = each.value  
  location = "westus"  
}
```

```
resource "azurerm_resource_group" "rg1" {  
  name     = "bambaiya-rg"  
  location = "westus"  
}
```

```
resource "azurerm_resource_group" "rg1" {  
  name     = "rasogolla-rg"  
  location = "westus"  
}
```

ForEach + Map

```
resource "azurerm_resource_group" "rg1" {  
  for_each = {  
    "bambaiya-rg" = "westus"  
    "rasogolla-rg" = "eastus"  
  }  
  name     = "tinku"  
  location = "westus"  
}
```

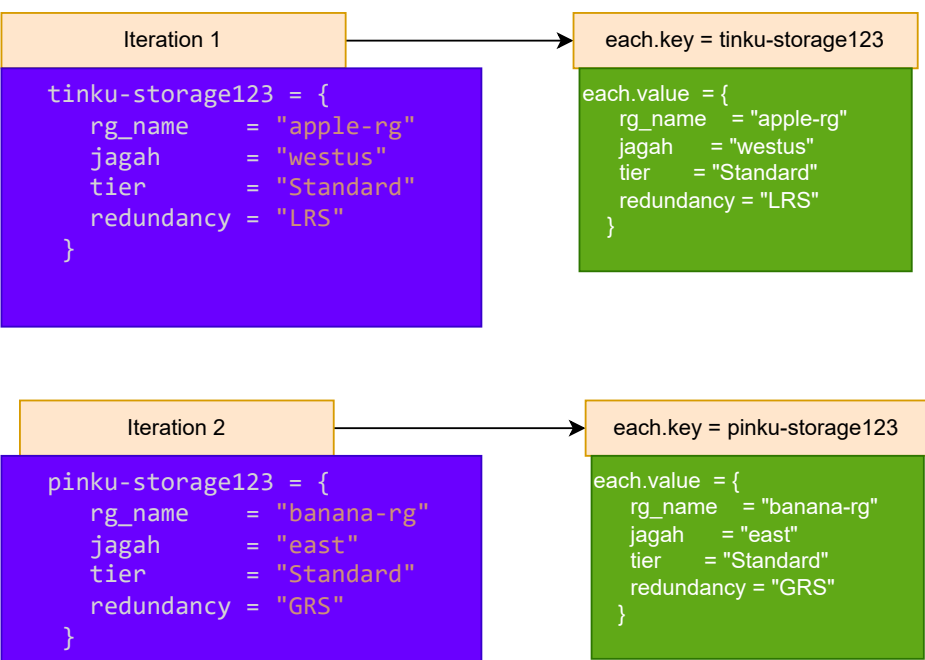

```
bfs = {  
  "jhunjhuna" = 5.2  
  "tuntuna" = 6.4  
}
```

```
bfs = {  
  "jhunjhuna" = {  
    height = 5.2  
    weight = 56kg  
    salary = 6 lakh  
  }  
  "tuntuna" = {  
    height = 6.4  
    weight = 94  
    salary = 3 lakh  
  }  
}
```

```
resource "azurerm_storage_account" "example" {  
  for_each = {  
    tinku-storage123 = {  
      rg_name = "apple-rg"  
      jagah   = "westus"  
      tier     = "Standard"  
      redundancy = "LRS"  
    }  
    pinku-storage123 = {  
      rg_name = "banana-rg"  
      jagah   = "east"  
      tier     = "Standard"  
      redundancy = "GRS"  
    }  
  }  
  name           = each.key  
  resource_group_name = each.value.rg_name  
  location       = each.value.jagah  
  account_tier   = each.value.tier  
  account_replication_type = each.value.redundancy  
}
```

Terraform Foreach + Nested Map

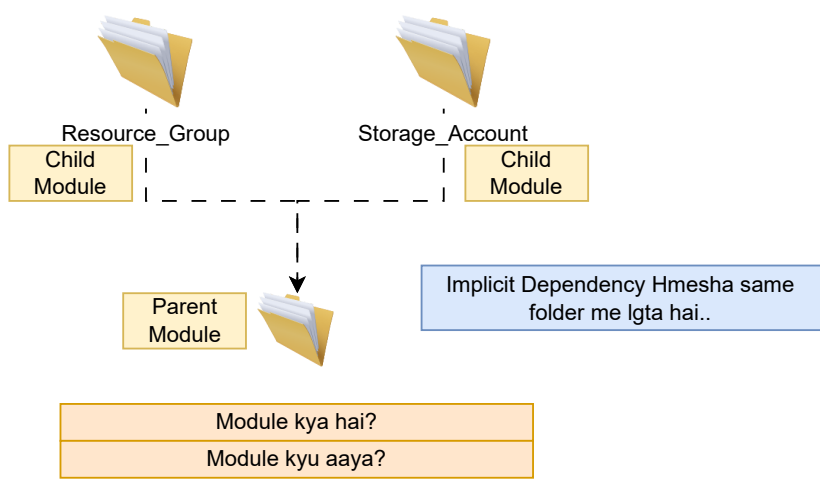

ForEach me kya jaa raha hai? list hai ya map?

List hai toh kitne elements hai?

Map hai toh kitni top level keys hai?

Jitne elements honge ya jitni keys hogi utni baar foreach ke iterations banenge

Iterations ko dimag me banane ka koshish karna.. starting me dikkat hoga lekin thode time me visualization aa jaega..

Resource group and storage account ke do alg alg folder bana ke

Kam se kam 10 baar practice karna hai..

Aur 10 aadmi ko screen share karke padana hai..

10 resource azure ka padne ka baad fir gemini cli/claude code se code likhna start karenge..
