

- Jaha Vnet bn gya usi region me vm bnegha
- Jis region me rg rhega us region me vnet, vm etc banana jaruri hai kya?

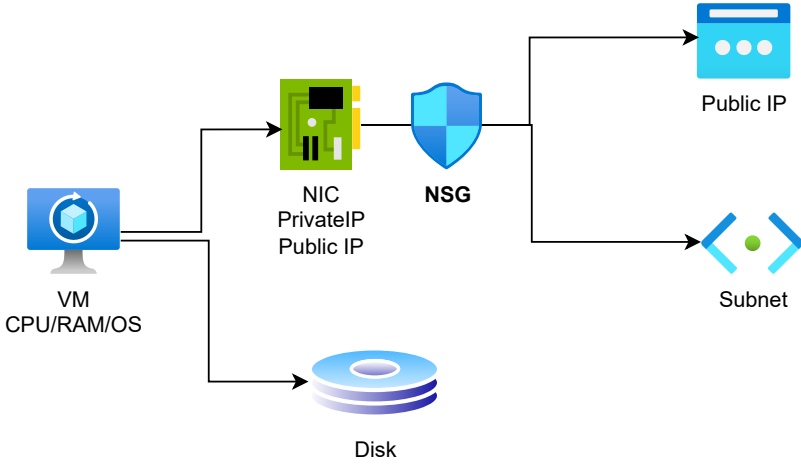

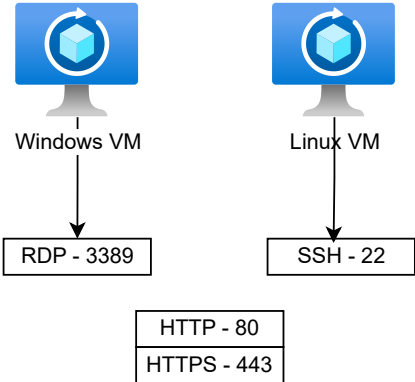

- Terraform ForEach + Nested Map se
1. Ek rg banana hai
2. Do Vnet banana hai
3. Do Vnet me 3-3 subnet banana hai
4. Teeno subnet ke andar me 1-1 vm banana hai
5. Ek vnet me alg alg subnet me alg alg vm hai toh connect ho jaegi
6. Alg alg vnet me agr vms hai toh connect nahi ho paegi

1. Apne laptop se RDP karke windows vm me public ip ke through ghusna hai
2. us vm ke andar Powershell open karna hai
3. ssh ke through dusri vm me ghus jana hai
4. nginx install karna hai
5. nginx ko open karke dekhna hai

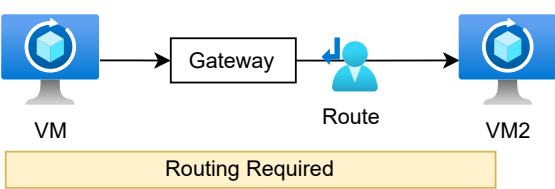

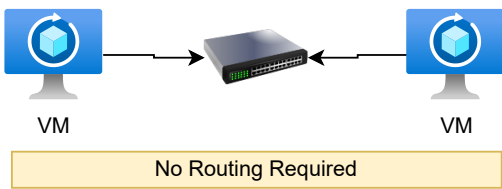

- Azure VM = RG, Compute(vm) + Network(Vnet/subnet + NIC + IP-private(mandatory)/public(optiona) + Storage(Disk) + Security (NSG)
1. Logical Container - jaha sab banega
2. Vnet - Software Defined Network
3. Subnet creations
4. VM details - vmname, size, ram, cpu, authentication, os
5. NIC Card to connect to network
6. Terraform se banate time sbka ek alg resource block banana pdega
7. Bina NIC ka vm duniya se disconnected hota hai
8. Booting Process

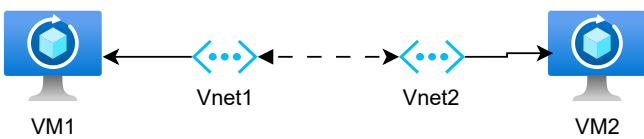

- Ek network ke andar me alg alg subnet hai
- Alg alg vms ko ek dusre se bat karna hai toh kaise traffic flow hota hai
- Kaise private and public ip se play karte hai
- VM check karta hai ki destination same network me hai ki alg network me hai
- Packet azure ke default gateway ko dedeta hai
- Azure SDN routing table check karta hai aur destination subnet
- Destination subnet identify karta hai and packet deliver karta hai

Same Network, Same Subnet

Same Network, Different Subnet

Different Network, Different Subnet

Public IP Hit karne ke baad kaise vm tk traffic flow hua?
